

the 1990s, the number of people in the world who are under 15 years of age has increased from 1.1 billion to 1.5 billion, and the number of people aged 65 and over has increased from 0.2 billion to 0.5 billion (United Nations 1999).

There are a number of reasons why the world population is ageing. First, the number of people who survive to old age has increased. This is due to a number of factors, including improved medical care, better nutrition, and a decline in the incidence of infectious diseases. Second, the number of people who are born has decreased. This is due to a number of factors, including a decline in the birth rate, and a decline in the number of people who are having children.

The ageing of the world population has a number of implications. First, it will increase the demand for health care and social services. Second, it will increase the demand for retirement income. Third, it will increase the demand for housing and transportation. Fourth, it will increase the demand for education and training. Fifth, it will increase the demand for employment opportunities.

There are a number of ways in which the world population can be managed to meet the needs of the ageing population. First, the birth rate can be reduced. This can be done by providing family planning services, and by increasing the age at which people are having children. Second, the number of people who survive to old age can be increased by improving medical care, and by providing better nutrition.
